

# Pre-service Teachers' perceptions on instant messaging and orthographic competence

Percepções dos professores em formação sobre mensagens instantâneas e competência ortográfica

## Abstract

This work examines the perception held by pre-service teachers of Spanish in Chile and Argentina of the digital written norm in IM, together with their opinion regarding the influence of textisms on secondary students' acquisition of orthographic competence. The study uses a transactional approach based on surveys and uses and applies a descriptive non-experimental design. Results, when compared with studies for the European Spanish variant, showed that pre-service teachers in Chile and Argentina considered use of textisms as harmful to secondary students' development of orthographic competence, despite their own frequent use of textisms. However, one of the main findings is a certain degree of tolerance of specific types of textisms in digital writing, as was a more integrative approach to those written variables on the part of participants in Argentina.

**Keywords:** Spanish. Spelling. Teacher education training. Social media.

## Abstract

Este trabalho examina a percepção que os professores espanhol em formação no Chile e na Argentina têm da norma escrita digital em mensagens instantâneas, juntamente com sua opinião sobre a influência dos textismos na aquisição de competência ortográfica por parte dos alunos do ensino médio. O estudo utiliza uma abordagem transacional baseada em pesquisas e usos e aplica um design descritivo não experimental. Os resultados, quando comparados com estudos da variante espanhola europeia, mostraram que professores de pré-serviço no Chile e na Argentina consideraram o uso de textos como prejudicial ao desenvolvimento da competência ortográfica dos alunos do ensino médio, apesar de seu próprio uso frequente de textos. Entretanto, uma das principais conclusões é um certo grau de tolerância de tipos específicos de textos na escrita digital, assim como uma abordagem mais integrativa dessas variáveis escritas por parte dos participantes na Argentina.

**Keywords:** Espanhol. Ortografia. Formação de professores. Redes sociais.

## 1 Introduction

According to the Latinobarómetro database (CORPORACIÓN LATINOBARÓMETRO, 2018), 60% of Latin Americans are frequent users of social networks and instant messaging (IM). Chile and Argentina are two of the countries with the highest incidence of use. In fact, 80% of Argentinians and 76% of Chileans identified as regular WhatsApp users, which was the most popular instant messaging service. The next most used were Facebook Messenger (68% of users in Chile and 67% Argentina) and Instagram (29% of users in Argentina and 27% in Chile) (CHEVALIER, 2019). Unquestionably, IM is the most used internet service in the Spanish-speaking world and, consequently, it is the medium by which texts are most frequently written in Spanish (MARTÍN, 2016).

Text messages have evolved into a new writing code, which has been called textese (JOHNSON, 2015) as well as digitalk (TURNER, 2010). The employment of this recently developed code in IM is not a juvenile alternative jargon (BETTI, 2006) or a linguistic prank, but a way of communicating that could, in fact, impact on conventional writing in Spanish (ALONSO; PEREA, 2008; MAS ÁLVAREZ; ZAS VARELA, 2012), and hence, on the way in which writing is taught. Even though 500 million people communicate in Spanish, most of them in South America, the pedagogical implications deriving from the incorporation of textese into day-to-day communications have not been given sufficient attention in the Latin American context.

## 1.1 IM and Language

IM has created a new code which is mainly characterized by its brevity and speed, the use of paralinguistic restitution, and phonological approximation (THURLOW; POFF, 2013; TURNER et al., 2014). Textisms, which are non-normative elements using characters that are not included in the standard norm, are among the main features of textese (JOHNSON, 2015).

Textisms comprise a diverse group of orthographic practices in Spanish: from the suppression of silent letters (h, for example), diagraph simplification (for example, ll, ch, qu, gu), simplification of graphemes representing the same phoneme (for example, b instead of v, l instead of y, or k instead of c or qu), or vowel suppressions, to writing number and mathematical symbols which are homophonous and using letters by their name (for example, x, +, t, and 2, instead of por, más, de, te and dos) (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018).

Research of the main western languages has arrived at different results for each. The style of text messages in English has been profusely described by Thurlow (2003), Crystal (2008), Plester, Wood, and Joshi (2009), Kemp and Bushnell (2011), De Jonge and Kemp (2012), Lyddy et al. (2014), Wood et al. (2014), Waldron, Wood, and Kemp (2017), and Kemp and Grace (2017). Studies by Bouillaud, Chanquoy, and Gombert (2007) for the French language compared textisms to standard orthography. Subsequently, Bernicot et al. (2014) distinguished two different groups of textisms: ones based on the correspondence between grapheme and morpheme (that is, those following the written standard norm), and ones that were not. That differentiation was confirmed by the results of recent studies of the perception of the digital norm for Italian (GOMÉZ-CAMACHO; NÚÑEZ-ROMÁN; PERERA-RODRÍGUEZ, 2016) and Portuguese (GOMÉZ-CAMACHO; LOPES, 2017). In a recent study, Androutsopoulos and Busch (2021) pointed out that the practices of non-formal writing typical of IM and social networks coexist with formal and academic writing practices and are configured as complementary to the norm, which has now been 'extended by fluid and local conventions that emerge in informal digital practices' (ANDROUTSOPOULOS; BUSCH, 2021, p. 8).

With regard to Peninsular Spanish, there is an increasing number of publications describing the characteristics of textese (CALERO, 2014; CAURCEL DÍAZ; ÍÑIGUEZ DEL RÍO; GÓMEZ HIDALGO, 2013; DOMÍNGUEZ CUESTA, 2005; GALÁN RODRÍGUEZ, 2002; LLISTERRI, 2002; MANCERA RUEDA, 2016; MAS ÁLVAREZ; ZAS VARELA, 2012; VÁZQUEZ-CANO; MENGUAL-ANDRÉS; ROIG-VILA, 2015). However, this area has barely been explored in the Latin American context, with a few notable exceptions. Giraldo Giraldo, Ríos Londoño, and Cardona Cifuentes (2018) explored Colombian students' perception of textisms, who considered the digital norm to be distant the academic norm and heavily determined by the communication medium; Cantamutto (2018, 2019), and Flores-Salgado and Castineira-Benitez (2018) analysed the digital discourse from a pragmatic perspective in Argentina and Mexico, respectively, and also, Cantamutto and Vela Delfa (2018, 2019), who compared the use of multimodal elements in Spain and Argentina.

Textisms were categorised into a taxonomy for the Spanish language in previous studies by Gómez-Camacho (2007), Gómez-Camacho, Hunt-Gómez, and Valverde-Macías (2018) and Hunt-Gómez, Núñez-Román, and Gómez-Camacho (2020). Considering these previous models, the present study offers a codification of textisms divided into repetitions, omissions, non-normative graphemes, lexical textisms and multimodal elements (Table 1). The classification of textisms in Spanish created a framework structured in three different levels: phonetic-phonological, lexical-semantic, and multimodal.

**Table 1.** Category of non-standard spelling.

Textisms	Keys	Examples
Emphatic repetitions - Inverted closing marks, repetition of one or more letters, emoticons, emphatic repetition, interjection, or onomatopoeia emphatic repetitions.	(Rep)	????, !!!!!, vaaaaale, amiiiiigo, ahhhh
Omissions - One or more letters by shortening, contraction, apocopation, syncope, aphaeresis, word reduction into consonant groups, joining two words -Punctuation marks total/partial omission - Tildes total/partial omission	(Short/Clipp) (PunOmi)	toy, te visto, tngo, nmbre
Lexical textisms - Dialectisms, regional varieties transcription, transcription of social and register varieties - Creation of new words, non-standard onomatopoeia or interjections, amalgams or conglomerations, foreign words, non-standard initials, or abbreviations	(AccSty) (NewWor)  potito, lok	asta, e pelao, ceñío, improvisao toas, torayá, pegá zii, dise, pfff, pifrii, sip, jartao, wasap, acronyms,
Multimodal elements - Emoticons, stickers - Images - Audios -Videos	(Mult)

## 1.2 Textisms, education and linguistic competence

Generally, the new written norm used in IM is considered a threat to Spanish standard writing, due partly to the allegedly negative repercussions on student writing outcomes at schools and universities (DE JONGE; KEMP, 2012; DROUIN; DRIVER, 2014; JOHNSON, 2015; THURLOW; POFF, 2013). However, a number of studies have challenged that assertion. Several studies for the English language and the links between digital norm and linguistic competence proved that use of IM had no prejudicial effects (BUSHNELL; KEMP; MARTIN, 2011; DROUIN, 2011; GANN; BARTOSZUK; ANDERSON, 2010; KEMP; BUSHNELL, 2011; PLESTER; WOOD; JOSHI, 2009; POWELL; DIXON, 2011; WOOD et al., 2014). Also, Verheijen, Spooren, and Kemenade (2020) concluded that use of language in social networks improved written competence when examined in Dutch students from different education levels. Also, Bouillaud, Chanquoy, and Gombert (2007), Bernicot et al. (2014), Lanchantin, Simoës-Perlant, and Largy (2014), and Coughon et al. (2017) proved that the use of IM does not negatively affect the standard norm in the case of French.

Research into digital writing is limited, as are studies exploring the digital norm and education in the Latin American context. On the other hand, there appears to be an increase in the number of studies regarding the educational influences of digital writing in Spain (CREMADES et al., 2019; LLOPIS-SUSIERRA; ANDRÉS-SEBASTIÁ, 2020). These studies generally showed a negative perception of the influence textisms had on standard writing and the acquisition of linguistic competence by teenagers (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018; HUNT-GÓMEZ; NÚÑEZ-ROMÁN; GÓMEZ-CAMACHO, 2020). Paradoxically, this happened even in those cases where the use of IM in the classroom was regarded as positive (CREMADES et al., 2019; LLOPIS-SUSIERRA; ANDRÉS-SEBASTIÁ, 2020). In the case of the different varieties of Spanish spoken in South America, research has mainly focused on two aspects: the use of IM as a pedagogical tool (ESCOBAR-MAMANI; GÓMEZ-ARTETA, 2020; GONZÁLEZ-SAMÉ; ROMERO-ROMERO, 2019), and the transformation seen in some higher education contexts due to the use of textese (VEYTIA-BUCHÉLI; GÓMEZ-GALÁN; VERGARA, 2020). In their study Escobar-Mamani and Gómez-Arteta

(2020) showed that Peruvian teenagers' use of WhatsApp as a didactic resource improved their written expression. However, the authors noticed a weakness in the tool, namely that grammatical and spelling errors were found in the messages.

Therefore, most of the research addressing digital norm perception and its influence on the acquisition of linguistic competence has focused on the orthographic elements of Peninsular, that is, European Spanish. Consequently, very little is currently known about this phenomenon and its impact in the development of orthographic competence in Latin America, where the largest number of Spanish-speakers live. Hence, this study explores this phenomenon in relation to pre-service teachers of Spanish in the Latin American context, as they should be aware of the increasing influence of the digital norm in standard writing and how it will affect their future teaching practices.

## 2 Methods

The study used a transactional approach. Data were collected in one session. It is based on surveys and uses and applies a descriptive non-experimental design.

### 2.1 Objectives

The main aims of this study were the following: 1) to determine the perception of pre-service teachers of Spanish in Chile and Argentina regarding the written norm of texts sent through their smartphones or shared in social media; 2) to determine their opinion of the impact of textism use on the orthographic competence of secondary education students; 3) to compare the results with those of previous research to determine if there were variances in the perception of textisms within the different varieties of the Spanish language.

### 2.2 Sample

The participants of the study were undergraduates in Education Sciences at six of the main universities in Chile and three in Argentina. A simple random sample was taken (N= 266 students, 162 from Chile and 104 from Argentina). A non-probability convenience sample was used (SABARIEGO PUIG, 2004), as subjects were selected through previously established contact with staff members at the different universities or with lecturers, who disseminated the questionnaires among the students.

At the time data were polled, all participants were pre-service teachers of Spanish. The average age of the subjects was 24.48 years, with 41 (14.42%) males and 255 (84.58%) females. 98.12% of the participants stated that they used IM applications, such as WhatsApp, on a daily basis, and only three of the subjects (1.12%) reported using them occasionally. A similar proportion was found regarding the use of social networks, used by 95.01% of the participants. Also, 86.84% of the subjects indicated that their use of textisms in their text messages and social networks (Facebook, Twitter, Instagram, etc.) varied depending on the person to whom the message was addressed.

### 2.3 Rating scale

A scale called 'Textisms and Written Norm in Spanish Teaching' was used. It was based on the categorisation included in (Table 1) and contained 39 items (37 items with a Likert scale format) and addressed the perceptions of pre-service teachers of Spanish in Chile and Argentina. This scale had been validated and applied to a similar sample of pre-service teachers of Spanish at universities in Spain (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018). The rating scale was individually administered to the subjects in December 2020 and January 2021 using Google Forms. There was no time restriction when completing it.

The scale contained three dimensions established a priori (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018), and each of them approached the perception of the textisms used in Spanish from three different angles. In Dimension 1, which dealt with orthographic mistakes and textisms, participants were asked whether the textisms included in (Table 1) were orthographic mistakes when written in text messages in Spanish. In Dimension 2, dealing with textism use and its repercussions for education, participants were asked if they considered whether textisms caused errors in secondary education students' formal texts. Finally, in Dimension 3, participants self-reported the

rate of recurrence in their use of each of the textisms included in the taxonomy.

The rating scale has been proven valid at both theoretical and empirical levels. Theoretically, it has been validated by the above-mentioned studies. Empirically, the validity of the rating scale was determined by the Multidimensional Scaling-PROXSCAL. The validity of each of the dimensions established a priori was determined using a Cronbach's alpha that reached a value for the whole scale of 0.89, which is considered highly positive (BORG; GROENEN; MAIR, 2013; O'HARE, 1980).

The validity of the scale scored values close to zero when measuring the stress statistical data, and the values for Dispersion Accounted For, DAF and Tucker's coefficient of congruence (TCC) scored close to one (Table 2). Also, internal consistency of each dimension scored values over 0.90. To sum up, results regarding the empirical validity of the instrument can be considered optimal.

**Table 2.** Psychometric indicators (reliability and validity) referred to the rating scale.

Dimension	Cronbach's alpha	Imbalance measurements				Adjustment measures	
		NRS	Stress I	Stress II	S-Stress	DAF	TCC
D1. Links between textisms and orthographical mistakes	0.898	0.0017	0.0412	0.016	0.0019	0.9983	0.9992

source: own elaboration.

Note: a Normalised Raw Stress.

### 3 Results

#### 3.1 Perception of textisms

Table 3 and Table 4 include a summing-up of the main descriptive statistical data obtained for each of the three dimensions that integrate the study. The comparison by countries referring to the links between textisms and orthographic mistakes (Dimension 1) showed a higher degree of association of the digital norm with orthographic mistakes in formal writing for the Spanish language among the participants in Chile ( $\bar{x}=3.59$ ) than for those in Argentina ( $\bar{x}=2.99$ ), the latter being closer to disagreement when textisms are considered orthographic mistakes. This trend was exacerbated for those textisms that intentionally contrary to orthographic rules (items 9, 10, 11, 12, and 14), while it decreased for those that presented no relation to standard orthographic rules (items 7, 13, 15 and 16). These results indicated that participants in the study were less conservative regarding acceptance of new digital writing norms when compared to the participants of the study undertaken for Spain ( $\bar{x}=3.83$ ). Thus, Latin American participants were closer to accepting a new digital norm divergent from those enshrined by the Spanish Royal Academy of Language (RAE) and the Association of Academies of the Spanish Language (ASALE).

Results obtained for Dimension 2 are consistent with those of Dimension 1. They showed a negative perception of the digital norm from the pedagogical perspective. In this case, participants in Chile also achieved a higher score ( $\bar{x}=3.60$ ) than those in Argentina ( $\bar{x}=3.05$ ). Again, Latin American speakers proved to be more innovative in the educational sphere than their equivalent European pre-service teachers of Spanish (Table 4). According to pre-service teachers of Spanish, the textisms that were more prejudicial to the learning of the standard orthographic norm were textisms intentionally contrary to the orthographic rules (items 9, 10, 11, and 14).

In apparent contradiction with the moderate rejection of textisms identified in the normative

and pedagogical spheres, participants acknowledged that they employed textisms in their own texts (Chile  $\bar{x}$ =3.00; Argentina  $\bar{x}$ =2.81), as seen in Table 5. This paradox was even more prominent among speakers of the European variant ( $\bar{x}$ =3.27), who reported using textisms frequently despite being the most conservative group. According to the results obtained for Dimensions 1 and 2, the most frequently used textisms are those that generate less rejection from a normative and pedagogical perspective (items 17, 18, and 26). Consequently, those textisms that are associated with orthographic mistakes and limitations in the development of the orthographic competence for secondary education studies are the ones (items 19, 20, 21, 22, and 23) less frequently used.

source: (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018)

### 3.2 Correlations between textisms

To established correlations between textisms, Pearson's product-moment correlation coefficient ( $N=266$ ,  $*p<.05$ ,  $**p<.01$ ) was applied to each of the three dimensions to examine the possible links between variables considering the whole of the sample, without distinguishing between the two countries. The data for each dimension, as well as how they correlate, are examined in the following sections.

### 3.3 Textisms and orthographic mistakes

Firstly, for Dimension 1 and its variables, which relate to the connection between textisms and orthographic mistakes, the presence of correlations among all the variables of the dimension was observed Table 6. It follows that all participants considered that, for the group of variables included in Dimension 1, all the different types of textisms presented were orthographic mistakes. This is consistent with the previous statements used to describe the main descriptive statistical data for Dimension 1. The use of multimodal elements (Mult, item 16) should have a different consideration, as it showed the lowest correlation of the textisms considered orthographic mistakes, with the scored value of  $\bar{x}=1.29$ , which differentiates it from the other textisms as being the only type not identified as a writing mistake. These results fully coincide with the results of the study undertaken in Spain (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018), so they confirm the existence of a moderate association between textisms and orthographic mistakes in a large part of the Spanish-speaking world (Argentina, Chile, and Spain).

### 3.4 Textisms and orthographic competence

Similar to Dimension 1, all variables from Dimension 2, which referred to the influence of textisms on orthographic competence of secondary education students, presented correlations among them. The analysed data showed that participants considered that the use of textisms by secondary education students could cause orthographic mistakes in their academic texts (Table 7).

The correlation levels among variables were generally medium/high, and higher than those found

**Table 6.** Correlation matrix representing Pearson's  $r$  between variables for Dimension 1 'Links between textisms and orthographical mistakes' ( $N = 266$ ,  $*p < .05$ ,  $**p < .01$ ).

source: own elaboration.

in Dimension 1. Therefore, the data indicated that participants in the study perceived orthographic mistakes in academic formal text written by teenagers in secondary education to be the main problem of the digital norm. Again, the use of emoticons, images, audio or videos (Mult) was considered the type of textism least influential on the production of formal texts.

These results are coherent with those from Gómez-Camacho, Hunt-Gómez, and Valverde-Macías (2018) for Spain. Consequently, according to the data, pre-service teachers of Spanish in Argentina, Chile, and Spain share the perception of textisms as an obstacle to the development of the orthographic competence of teenagers.

source: own elaboration.

The significant correlation between the variables of Dimensions 1 and 2 (except Mult, item 16) confirms the previous results for a great part of the Spanish-speaking world (Table 8). The more textisms are perceived as orthographic mistakes, the more they are considered a negative influence on students' linguistic competence.

### 3.5 Textisms use

Correlations for Dimension 3 failed to provide useful data for the purpose of this study, except for multimodal elements (Mult, item 26), which presented a lower correlation degree with the other

textisms (Table 9). That indicates that participants use this type of textism in their IM, even if they do not use the others with the same frequency, which is coherent with the score the item received in the descriptive statistical data for the entire sample ( $\bar{x}=4.6$ ), far above the scores of the other textisms (see (Table 5).

source: own elaboration.

Another noteworthy aspect of the Dimension 3 variables is the negative correlation between 'New-Word' and 'Mult' with those variables of Dimensions 1 and 2 (Table 10. It follows that participants who used those words, that is, onomatopoeic or exclamatory expressions diverging from the norm, foreign words or acronyms, and also emoticons, images, audios, or videos, tended to consider the use of textisms less as orthographic mistakes. Also, those participants showed a lower perception of the prejudicial influence of textisms on secondary students' formal texts.

These results are consistent with those obtained by the Spanish study (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018). Therefore, it can be concluded that the use of neologisms in IM and, mostly, the use of non-verbal multimodal elements does not conflict with the linguistic or pedagogical sphere, according to pre-service teachers of Spanish, regardless of nationality.

Finally, another noteworthy feature related to Dimension 3 was participant age. A negative cor-

relation was established between the age variable of the participants and all variables of Dimension 3 (Table 11). That means that the younger the participant, the greater the use of textisms. This is particularly marked in the use of multimodal elements or images (Mult) ( $p = -2.17$ ). No significant differences were found between male and female subjects.

**Table 11.** Correlation matrix representing Pearson's  $r$  between variable age and Dimension 3 'Textisms use' ( $N = 266$ , \* $p < .05$ , \*\* $p < .01$ ).

## 4 Discussion

With regard to Chile and Argentina, and the perception among pre-service teachers of Spanish of the written norm used in mobile mediated communication and its relationship with standard writing, the results show a clear association between textism use and orthographical mistakes in the academic context. This tendency was more apparent the more the textisms diverged from the orthographic rules, as those textisms contrary to the norm were given the lowest values by the subjects of the study. These data are consistent with previous studies by Gómez-Camacho, Hunt-Gómez, and Valverde-Macías (2018) and by Cremades et al. (2019), which focused on in-service and pre-service teachers. Both studies proved that orthographic and punctuation mistakes typical of the digital norm could be extensively transferred into any language use context.

Nonetheless, participants stated that they regularly used textisms in IM. It is remarkable that those textisms that reported a higher frequency of use among pre-service teachers were those that provoked a minor degree of rejection from a pedagogical perspective and which were less divergent from the standard norm. Along the same line, textisms associated with orthographic mistakes presented a lower frequency of use (GOMÉZ-CAMACHO; NÚÑEZ-ROMÁN; PERERA-RODRÍGUEZ, 2016; GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018).

A strong link was established between use of textisms and their impact on the orthographic competence of secondary education students. Textisms intentionally contrary to academic norms received lower values from a didactic point of view and were considered to be harmful to the development of teenagers' orthographic competence. This finding is contrary to previous studies for English (KEMP; BUSHNELL, 2011) and French (BERNICOT et al., 2014; COUGNON et al., 2017); it has been suggested that textisms are not a threat to the acquisition of linguistic competence in either of those languages.

Even if all textisms were, in practice, perceived to be orthographical mistakes and prejudicial to the development of Spanish orthographic competence, multimodal textisms were considered part of the digital norm and were less frequently perceived to be mistakes (GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018).

In relation to this identified greater tolerance of multimodal textisms, a group of participants showing a lower perception of textisms as orthographic errors and considering them to be less prejudicial to orthography was detected. That group was, as a matter of fact, made up of those pre-service teachers of Spanish who self-reported regular use of multimodal elements and digital neologisms, textisms that do not interfere with the academic rules and which cannot be deemed unacceptable in an educational context.

A clear difference was established between the use of textisms made by the subjects of the study and their perception of the impact of textisms use on teenagers' development of orthographic competence. It means that pre-service teachers of Spanish use textisms regularly in their IM while believing that it does not affect their orthography. At the same time, they consider that use of textisms by secondary education students could lead those students to make orthographic mistakes in their formal texts. These results corroborate the trend observed in previous studies (BOUILLAUD; CHANQUOY; GOMBERT, 2007; GOMÉZ-CAMACHO; NÚÑEZ-ROMÁN; PERERA-RODRÍGUEZ, 2016; GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018; PLESTER; WOOD; BELL, 2008; VÁZQUEZ-CANO; MENGUAL-ANDRÉS; ROIG-VILA, 2015), which showed that the negative consideration of textisms used is generally attributed to younger people, omitting the practices of older users. In this sense, it must be highlighted that the youngest participants of the study, regardless of their country of origin, showed a tendency to use a wider variety of textisms in their messaging, especially intense in the use of multimodal elements, as observed in previous studies (PLESTER; WOOD; BELL, 2008; POWELL; DIXON, 2011; GOMÉZ-CAMACHO; HUNT-GÓMEZ; VALVERDE-MACÍAS, 2018). This negative perception shown by pre-service teachers of Spanish regarding the impact of the use of textisms on teenagers' orthographic competence highlights a weakness in teacher-training, also identified by Cremades et al. (2019), namely a belief among participants that the increasing influence of IM should be valued and given a relevant position in compulsory education.

Even if results are similar for the different varieties of Spanish examined, some small variations were observed. Participants in Argentina were less conservative in their perception of textisms as orthographic mistakes when compared with those in Chile, and even less so when compared with pre-service teachers in Spain. Generally speaking, pre-service teachers of Spanish in Chile perceived textisms in a similar way to their counterparts in Spain as regards their negative influence on orthography. However, Argentinian subjects were more receptive to the coexistence of new elements belonging to the digital norm alongside the academic norm.

Together with Spanish participants, Chilean subjects were the most conservative, which corroborates the linguistic conception of the countries analysed. Chile has a linguistic culture founded on the premise that Peninsular Spanish is pre-eminent, as is the authority of institutions such as the Spanish Royal Academy of Language (ROJAS, 2012). Linguistic beliefs of pre-service teachers of Spanish from Chile are based on the concepts of unity and pan-hispanic correctness. Data regarding the Argentinian participants are consistent with some studies which indicated that speakers not only rejected this sole linguistic model, but also recognised different centres as transmitters of the norm and defended linguistic diversity as an enriching element (LLULL; PINARDI, 2014; GUTIÉRREZ BOHMER; BORZI, 2018).

Finally, it is paradoxical that speakers of the European variant of Spanish, who more negatively valued textisms and their influence on formal texts, were the ones presenting the higher frequency of use of textisms. However, Argentinian pre-service teachers of Spanish, who reported a minor use of textisms in their IM, were those who showed a higher degree of tolerance of the digital norm.

## 5 Conclusions

This study regarding Argentinian and Chilean pre-service teachers' perception of the digital norm and the impact it has on teenagers' acquisition of orthographical competence led to some interesting

results. Firstly, pre-service teachers of Spanish presented a negative perception of textism use. They also considered that using textisms is harmful to the development of the orthographic competence of teenagers, even if participants recognised using textisms regularly while believing that such use does not negatively impact their own writing when the standard norm is required.

Secondly, a clear differentiation between those textisms that deviated from the academic norm and those that did not clash with the linguistic or the pedagogical sphere, such as neologisms and multimodal elements. The ones in the first group were less frequently used and were considered to be a possible source of mistakes in teenagers' texts. In the second group, multimodal elements and neologisms were considered a minor threat to teenagers' linguistic acquisition and reported a higher use among pre-service teachers of Spanish.

Thirdly, the study allowed us to determine disparities between the perceptions of pre-service teachers of Spanish in Chile and Argentina. Participants in Chile showed a more negative perception of textisms and their impact on teenagers than did their counterparts in Argentina, and the former were closer to the position of pre-service teachers of Spanish in Spain, who are the most conservative in their rejection of the digital norm. Paradoxically, those who reported using more textisms in their IM (subjects in Spain and Chile), presented a higher negative perception of the impact of textism use on secondary students' orthographic competence. Argentinian pre-service teachers, who self-reported a lower use of textisms in IM, showed less rejection of the consequences of their use.

This study has shed some light on the difficulties arising from the interaction of the digital norm and the standard written norm in the educative context for pre-service teachers of Spanish in Argentina, Chile, and Spain, even though they have received their education in a digital context. In spite of that, a greater tolerance is envisaged regarding some textisms, such as multimodal elements and digital neologisms, which could come to be a meeting point between the digital and the standard norms, and, therefore, foster an environment in which the difficulties posed by their complicated coexistence are overcome. In this regard, the training of pre-service teachers of Spanish should emphasise the coexistence of the digital and standard norms and devote more attention to digital writing in the classroom so as to improve the negative perception of pre-service teachers of Spanish of the impact of textism use on teenagers' orthographic competence.

## 6 Source of funding

This research has been funded by the Department of Economy, Knowledge, Business and University of the Autonomous Community of Andalusia (Spain), in the framework of the Incentives to Research Groups PAI (Call 2019), reference 2019/HUM529.
